

Flight Attendants learn Emergency and Safety Procedures using TOA Equipment

Manufacturing Cabin Trainers for Flight Safety International, Aviation Reproductions Inc. creates a training facility for flight attendants to learn how effectively perform their job, especially in emergency situations. Located in Mississauga, Ontario, Aviation Reproduction Inc. is one of five companies worldwide that manufactures Cabin Trainers.

Aviation Reproduction Inc. started with a 100' fuselage and custom designed many of the training facilities features, including its communication system. When Danny Ferrone, President of Aviation Reproduction Inc., approached TOA Canada, his communication requirements involved paging, handset to handset and handset to cabin speaker communication. They also required the simulation of rain, hail, runway noise, etc. so that the flight attendant trainee's could experience a true-to-life simulation.

The National Sales Manager for TOA Canada Corporation was very impressed with the professionalism he saw from the staff of Aviation Reproductions Inc.; on the other hand, Mr. Danny Ferrone was impressed with the flexibility of TOA's product. They were able design a communications system that would allow the existing 6 ohm transformerless cabin speakers to power the speakers in the handsets, driven with a line-level signal, using TOA's M-9000 Series Mixer/Matrix.

"When shopping for a solution to our communications system, TOA opened their doors to us. They helped us to define a solution for our specific needs." explained Danny Ferrone. "We wouldn't have been able to design the audio system without Paul Rennick's technical experience and knowledge."

This is a perfect example of how flexibility, state of art equipment and technology, can come together to resolve a challenging audio unique situation.
